Notes:

- Design targets Revision 'A' of the LPC182x
- Pins with more than one function are labeled with their pin name and function(s) used
- VDD controls LPC182x, RF Transceiver, LCD Touchscreen Controller, and Motion Sensor so that these can wake up the device
- VDDIO powers microSD, GPS Module, and LCD Display along with all LPC182x IO pins so that these can be disabled in low-power modes.
- Only WAKEUP pin can wake up device from Deep Sleep and Power-Down Modes
- USB0 can wake up device only from Sleep Mode
- Power Consumption: Normal 10mA+, Sleep 5.5mA+, Other <1mA

Size: A4

Date: 1 jun 2012

Rev: 1.0

KiCad E.D.A.

Id: 1/9

Notes:

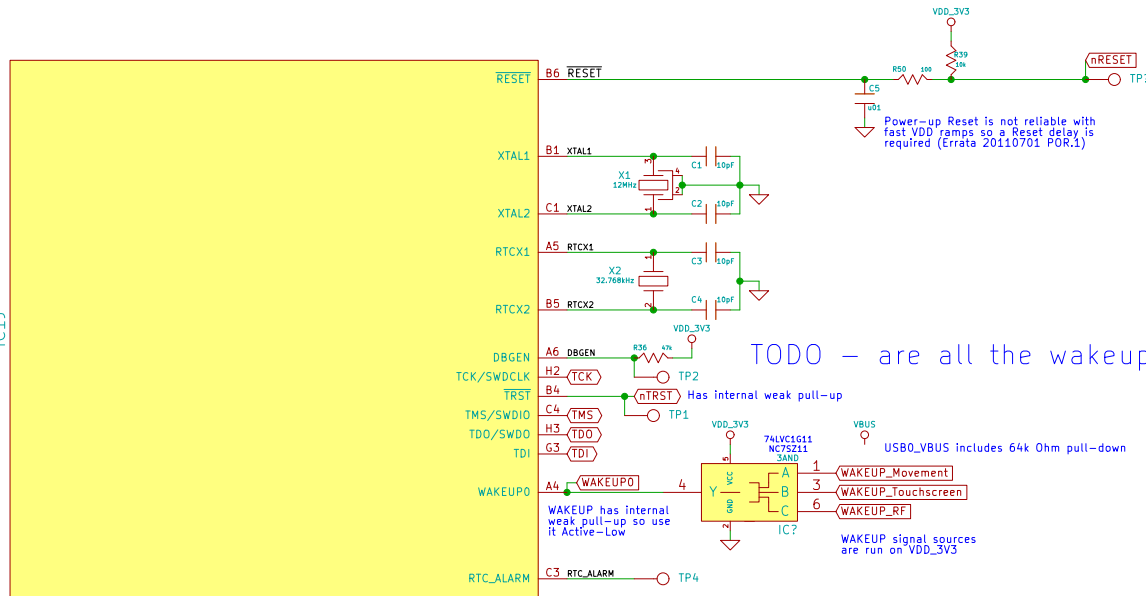

- Run core system on always-on VDD_3V3
- Rpu is min. 45k Ohm, so for boot selection pull-down resistor, 19k is max. usable as $3.3(19/(19+45))=0.98V < V_{il}=(3.3*3)=1V$
- LTC3559 soft-start takes 500us but $V_{ih}(EN2)=1.2V$ means that VDD ramp will begin VDDIO ramp after about 200us. VDDIO should be $>2.0V=V_{ih}(GPIO)$ about 300us after $VDD>1.2V$ or 500us after VDD ramp begins. $V_{ih}(RESET)=0.8*(3.3-0.35)=2.3V$ which means RESET will be deasserted about 350us after VDD ramp starts. LPC182x has a 250us wake up delay after RESET which means that it will check boot mode pins after about $350+250=600us$ which is about 100us after VDDIO boot mode pull-ups are $>V_{ih}(GPIO)$

JTAG

TDO need not be pulled up since TCK pull-down ensures no random data is ever sent as TDO is only valid when clock is valid.

LPC182x
IC1J

TODO – are all the wakeup signals Active-LOW

Boot Mode Selection

Boot Mode	P2_9(A0)	P2_8(A8)	P1_1(A6)	P1_2(A7)
SPIFI	LOW	LOW	HIGH	LOW
USB0	LOW	HIGH	HIGH	LOW
USART0	LOW	LOW	LOW	LOW
EMC 8-Bit	LOW	LOW	LOW	HIGH
EMC 16-Bit	LOW	LOW	HIGH	HIGH
EMC 32-Bit	LOW	HIGH	LOW	LOW
USB1	LOW	HIGH	LOW	HIGH
SPI (SSP)	LOW	HIGH	HIGH	HIGH
USART3	HIGH	LOW	LOW	LOW

Note boot pins have weak internal pull-ups of about 50k Ohm to VDDIO
Taken from LPC18x0 Datasheet – Table 5

KiCad E.D.A. Id: 7/9

- Boot pins have weak internal pull-ups of about 50k Ohm to VDDIO
- SPVDDIO_3V3 must be enabled at startup
- HPWR and SUSP have 2M Ohm weak pull-downs
- both regulators output 3.3V nominal but lowering the voltage to 3.0V will reduce power and be within all components' supply margins
- use low ESL reverse geometry X?R caps closest to device
- BAT54C reverse leakage is maximum 2uA. Take note of this
- if VBUS is used as a logic input since Ii for 74LVC is 5uA max.

Notes

- Enable the Touchscreen controller to wake up the processor
- Run STMPE610 on always-on VDD to enable Touchscreen wakeup
- Run LCD on VDDIO since it does not need to always be on
- GPIO0_12 is a High Drive Strength Pin that can source 32mA to the LCD Backlight LED

- Target 315MHz RF Bad (Short Data Packets, No Streaming, Limited Power) for Sensor Nodes
- Use to transfer Identification and Control signals between nodes
- Refer to Linx Application Note AN-00125 for FCC15.231 A-D Overview
- CC1125 DS 1.12: $315/40=7.9$, $40*8=320$, $(320-315)=5>1\text{MHz TX}$, similar for XOSC/2 for RX
- Use always-on VDD for power to enable Wake-On-Radio function
- MISO and MOSI are used in System sheet to define boot order
- MISO (P1_1) has a 50k pull-up
- MOSI (P1_2) has a 10k pull-down
- All capacitors should be X7R or C0G/NPO
- For CC1120, use a 32MHz X3

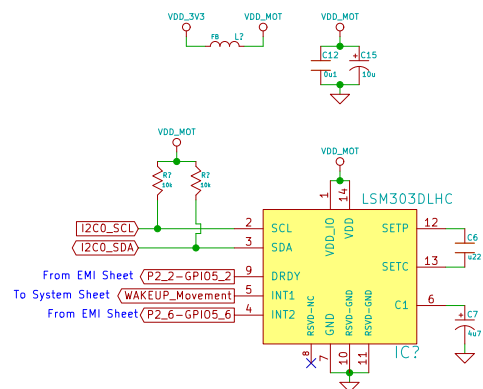

Id: 4/9

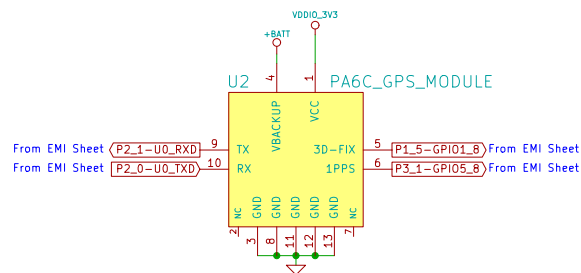

Notes:

- separate the LSM303 from all other electronics
- do not place a GND plane underneath the LSM303
- keep inductors and ferrites very far from the LSM303
- avoid ferrous materials like nickel near the LSM303
- X?R ceramic capacitor materials are ferrous, use COG/NP0 or tantalum
- set LSM303 INT1 interrupt to Active-Low wakeup the LPC182x
- LSM303 is powered by always-on VDD_3V3 to enable the LSM303 to wake up the LPC182x when in motion
- PA6C is powered by VDDIO_3V3 so that it can be turned off when the device is not in motion
- PA6C VBACKUP is 2V to 4.3V so direct Li-Ion power is OK
- The 1PPS signal is connected to an interruptable GPIO pin so that it can be used as a global timebase for RF
